**SUBJECT: Operable Unit (OU) 4 - Interim Remedial Action (IRA)
Performance Monitoring and Sampling Plan (PM&SP) - Quarterly Report #2
Naval Training Center (NTC), Orlando, Florida
CTO 107, Contract No. N62467-89-D-031/107**

Dear Ms. Nwokike:

Harding Lawson Associates (HLA) has completed the second quarter of activities described in the Performance Monitoring and Sampling Plan (PM&SP) located in Appendix B of the Interim Remedial Action (IRA): Conceptual Design and Performance Specification, Operable Unit 4 (OU 4). A brief background of the site history and conditions at OU 4, as well as a technology description of the recirculation wells can also be found in that document.

The objective of the PM&SP is to collect field sampling data and report the results to evaluate the effectiveness of the IRA. The first quarterly report was issued on April 16, 1998, and covered the period from December 10, 1997 through March 12, 1998. This second quarterly report covers the period from March 15, 1998 through August 31, 1998, and includes monitoring of: 1) associated groundwater within and downgradient of the treatment zone; 2) the hydraulic effect of the recirculation wells on the surficial aquifer; and 3) the system's stripping efficiency (influent and effluent concentrations).

The PM&SP was suspended for the two-month period from mid-March to mid-May because of a system (packer) failure and subsequent repair and maintenance (discussed below in greater detail). The reporting period for this summary was therefore extended through August to cover three full months of operation.

This quarterly report will discuss the following: system operation activities; hydraulic performance, groundwater contaminant concentrations in the influent and effluent of the treatment system(s), air emissions produced by the treatment system(s), groundwater contaminant concentrations in monitoring wells and drive points, conclusions and recommendations, and projected activities for the next quarter.

SYSTEM OPERATION

The OU4 IRA treatment system consists of 2 recirculation wells designated UVB-1 and UVB-2 as shown in Figure 1. The treatment system was started on December 10, 1997 and was shutdown for short durations throughout the startup activities and during the first monitoring period ending

March 12, 1998. Although the IRA continued to operate, hydraulic data collected during the month of March 1998 was suggesting a decrease in pumping performance. Subsequent evaluation by SBP Technologies, Inc. (SBP), Bechtel, and HLA determined that an equipment (packer) failure had occurred, and repairs were required. Both wells received maintenance, repair, and modification during April and May 1998. Both systems were restarted on May 15, 1998 and operated continuously (with the exception of occasional shutdowns) through the end of this reporting period (August 31, 1998).

IRA MODIFICATIONS

During the April-May 1998 downtime, the packers in each well were replaced with redesigned units that were expected to solve the failure problem. Internal high density polyethylene (HDPE) piping was replaced with rigid aluminum to improve durability. A pair of shallow/deep piezometers (OLD-13-OW12 and -OW13) were also installed within the UVB-2 radius of influence, and each was fitted with a Troll to monitor water levels. Hydraulic monitoring of UVB-2 performance was now possible. A Troll was also installed in the upper portion of each UVB well to allow monitoring of drawdown during pumping. Fine sand that had accumulated in each well was removed, and the wells were over-pumped. Miscellaneous improvements were also made to various valves, gauges, and flow meters to improve the accuracy and reliability of the systems designed to monitor the mechanical performance of each well. A more detailed summary of these modifications can be provided by Bechtel.

HYDRAULIC PERFORMANCE

The head response study was used to evaluate and verify the zone of influence generated by the treatment systems. Head response was monitored in six wells adjacent to UVB-1 and two wells near UVB-2. Data from the background well (OLD-13-03A) was not routinely downloaded, as the first Quarterly Report determined that overall aquifer changes were apparent in the wells near the IRA.

The eight wells being monitored are arranged in four clusters of two wells as shown on Figure 1. Three clusters monitor the hydraulic performance of UVB-1: OLD-13-OW6A and OLD-13-OW7C, OLD-13-OW8A and OLD-13-OW9C, and OLD-13-OW10A and OLD-13-OW11C. These clusters are located north of UVB-1 approximately 50, 30, and 15 feet, respectively. OLD-13-OW12A and OLD-13-OW13C are located approximately 15 feet south of UVB-2, and monitor UVB-2's performance. Each cluster is made up of one shallow (A-interval) well screened from 6 to 11 feet below land surface (bls) and one deep (C-interval) well screened from 40 to 45 feet bls. The shallow wells are influenced by the groundwater extracted by each recirculation well, while the deeper wells in each cluster monitor the zone at which the treated water is being returned to the aquifer. This extraction/injection process creates an upward circulation pattern in the aquifer, resulting in a water level differential between the shallow and deep piezometers. The magnitude of the differential is a function of the recirculation rate.

All eight observation wells are currently being monitored using TROLLs Model SP4000, manufactured by In-Situ Incorporated. An SP4000 has also been installed in each recirculation well to monitor drawdown.

March 12, 1999

Page 3

Due to operational problems, gaps in the sequence of data collection exist. However, necessary adjustments were being performed by SBP. The comprehensive water level data tables are found in Attachment A.

Hydrographs showing water level elevations versus date are included in Attachment B. Note that the dates are referenced to the restart date of May 15, 1998, as the wells were essentially not operating prior to that date during this period. Hydrographs are provided for each well pair: OLD-13-OW06A/OLD-13-OW7C, -OW8A/-OW9C, -OW10A/-OW11C, and -OW12A/-OW13C. Water levels for both UVB-1 and UVB-2 are also included. A plot of rainfall data for the same time period is also attached. This information helps to distinguish between the natural fluctuations of the water level due to precipitation and the affects that the treatment system has on the surficial aquifer.

The daily rainfall data was obtained from the National Weather Service, which operates a weather station at the Orlando International Airport (OIA), beginning May 1998. OIA is located approximately 15 miles south-southeast of the site. All rainfall data is included in Attachment C.

Wells -OW10A and -OW11C are located 15 feet from UVB-1, and therefore exhibit the greatest response to pumping rate in that recirculation well. Well pairs -OW 8A/-OW9C and -OW6A/-OW7C respond to a lesser extent because of the increasing distance from UVB-1. The head differential in -OW10A/-OW11C was approximately 1 foot at the beginning of this period. This differential appears to correspond to recirculation rates in the 8 gallon per minute (gpm) range, based on previous data. However, over time, the differential decreased to approximately 0.5 feet at the end of June 1998. This decrease corresponded to decreasing injection rates through the lower screen, due to increasing injection pressures and possible pump/well fouling. July was a difficult month to evaluate differentials due to disruption of the aquifer by frequent large rain events. However, in general, UVB-1 hydraulic performance continued to erode during this period. Recirculation rates decreased to the 3 to 4 gpm range.

In general, UVB-2 exhibited better hydraulic performance than UVB-1 during this period. The hydrograph for -OW12/-OW13 shows a relatively constant head differential from mid-May to early July 1998. Water levels in UVB-2 generally decreased during this period (i.e., increasing drawdown), and this has been attributed in part to a receding water table (drought conditions existed in Orlando for much of May and June) and possibly to decreasing well efficiency. Recirculation rates in UVB-2 were fairly constant during this period, in the range of 7 gpm.

In mid-July 1998, the hydraulic performance of both recirculation wells decreased. Recirculation rates varied between 1 and 3 gpm. Disassembly and inspection of the wells in July and again later in August found fine silt clogging pump impellers, and fine sand collected in the bottom of the wells almost to the top of the injection screen. After the systems were cleaned, pumping rates could be increased to 3 to 5 gpm, but within a week again began to decrease. At the end of August 1998, HLA, Bechtel, and SBP were evaluating potential system modifications to improve hydraulic performance.

INFLUENT AND EFFLUENT DATA

Water samples were collected from the influent and effluent ports of UVB-1 and UVB-2 on May 29, June 15, June 28, July 9, and August 18, 1998. The samples were collected in 40 milliliter (ml) vials preserved with hydrochloric acid (HCl) and shipped to an offsite laboratory for analysis using United States Environmental Protection Agency (USEPA) Method 8021 for volatile organic compounds (VOCs). Tables summarizing the results of these sampling events can be found in Attachment D. This data was collected to measure the efficiency of the recirculation wells and ensure treated groundwater met proper discharge criteria.

The efficiency of the stripping wells can be determined by comparing the influent and effluent total VOC concentrations. The stripping efficiencies for both UVB-1 and UVB-2 ranged between 88 percent and 96 percent during each sampling event.

Table 1-1 from the IRA: Conceptual Design and Performance Specification, OU 4 defined the treatment sphere discharge criteria for tetrachloroethene (PCE) as 8 micrograms per liter ($\mu\text{g/l}$), trichloroethene (TCE) as 80 $\mu\text{g/l}$, and total 1,2-DCE as 70 $\mu\text{g/l}$. These discharge criteria were established based on Florida's Surface Water Quality Standards for chemicals with an assigned standard. All other effluent contaminants of concern should meet Florida's maximum contaminant levels, where applicable.

The effluent discharge criteria for PCE at UVB-1 was exceeded on June 28 (20.0 $\mu\text{g/l}$) and July 9 (9.9 $\mu\text{g/l}$). In addition, the effluent discharge criteria for total 1,2-DCE at UVB-1 was exceeded on May 29 (98 $\mu\text{g/l}$) and June 28 (99 $\mu\text{g/l}$). Results from the June 15 and August 18 sampling events indicated that effluent concentrations for all contaminants of concern at UVB-1 were below the necessary criteria. The total influent VOC concentrations measured at UVB-1 fluctuated between 185 $\mu\text{g/l}$ and 1,640 $\mu\text{g/l}$ throughout the quarter, likely due to the variations in recirculation rate during this period. Likewise, variations in flowrate (and therefore air/water ratio) can account for the variations in stripping efficiency.

The effluent discharge criteria at UVB-2 were not exceeded during any of the second quarter sampling events. However, contaminant concentrations in the UVB-2 capture zone are generally lower than concentrations found in the UVB-1 capture zone. Total influent VOCs measured during the quarter at UVB-2 averaged 264 $\mu\text{g/l}$ and discharged back into the aquifer at an average of 22 $\mu\text{g/l}$.

MONITORING AND DRIVE POINT WELLS

The drive points and monitoring wells scheduled to be sampled were revised following the March-May shutdown. Evaluation of the sampling results from the first quarter showed fewer samples would be adequate for monitoring system performance, which allowed several additional sampling events to occur within the PM&SP budget. The drive point wells and monitoring wells were sampled on May 29, July 9, and August 18, 1998. The samples were analyzed at an offsite laboratory for halogenated VOCs using USEPA Method 8021. A summary of the VOC results is found in Attachment D.

Monitoring wells that were sampled were OLD-13-09A and OLD-13-22B. The drive points that were sampled were DP-2 and DP-5.

Monitoring well OLD-13-09A is located approximately 100 feet west of UVB-1 at the edge of Lake Druid. Laboratory analytical results from this quarter indicate VOC concentrations of 3,890 $\mu\text{g/l}$, 3,090 $\mu\text{g/l}$, and 1060 $\mu\text{g/l}$, respectively. These results indicate a gradual decrease in the concentration of VOCs in groundwater discharging to Lake Druid.

Monitoring well OLD-13-22B is located approximately 20 feet south of UVB-1, and is screened within the recirculation cell from 27 to 32 feet bls. The VOC concentrations in this well decreased from 243 $\mu\text{g/l}$ to 82 $\mu\text{g/l}$ during this quarter. Note that total VOC concentrations in this well were over 1,500 $\mu\text{g/l}$ at the end of the first quarter (March 12, 1998). This suggests that in two weeks of operation (from the May 15 startup date to the May 29 sampling date), UVB-1 reduced groundwater VOC concentrations at this location by a factor of 5. The dramatic decrease in VOC concentrations in OLD-13-22B provides direct evidence that UVB-1 can rapidly reduce VOC concentrations within the recirculation zone.

Laboratory analytical results for drive point well DP-2 indicate a decrease in total VOC concentrations from 1,780 $\mu\text{g/l}$ on May 29 to 1,380 $\mu\text{g/l}$ on August 18. Interpretation of this data must also consider that VOC concentrations in groundwater from this drive point were between 5,000 and 7,000 $\mu\text{g/l}$ during the first quarter. The second quarter results represent a dramatic decrease in VOC concentrations in groundwater discharging to Lake Druid, and likely indicate that treated water from the IRA has begun reaching the lake. Recall that the U.S. Geological Survey (USGS) predicted that treated water discharged from UVB-1 would require 3 to 6 months to reach Lake Druid.

Total VOC concentrations in groundwater collected from DP-5 decreased from 820 $\mu\text{g/l}$ on May 29 to 550 $\mu\text{g/l}$ on August 18. DP-5 had not been sampled during the first quarter, but the gradual decrease observed during this period is consistent with the results from DP-2. For comparison, 2,286 $\mu\text{g/l}$ total VOCs were detected in a groundwater sample collected from DP-5 in December 1997.

The overall trend of VOC concentrations in downgradient monitoring wells and drive points is shown on Figure 2.

AIR EMISSIONS

Offgas samples were collected for the first quarterly report on February 4 and February 19, 1998 from both systems and analyzed for VOCs using USEPA Method TO14. The total mass of contaminants emitted from both UVB-1 and UVB-2 combined was less than 0.2 pounds per day. Since recirculation rates and the influent/effluent concentrations of VOCs have generally decreased from the first quarter, it can be assumed that emissions are still far below the FDEP maximum limit of 13.7 pounds per day.

Harding Lawson Associates

CONCLUSIONS AND RECOMMENDATIONS

Despite the difficulties in maintaining the hydraulic performance of the IRA, downgradient VOC concentrations have decreased, indicating that the recirculation wells have succeeded in reducing the mass of contaminants discharging to Lake Druid. System modifications are being evaluated to increase and maintain the groundwater recirculation rate of each well.

In closing, further monitoring of the treatment systems' influent and effluent data will be performed during the third quarter. If you have questions or comments regarding this matter, please call Mark Salvetti at (781) 245-6606 or Mark Todaro at (407) 895-8845.

Very Truly Yours,

Monthly Summary

Temperature

Average Monthly Temperature	77.7	Which is	0.8	Degrees from normal
Average Daily Maximum Temperature	89.8	Which is	2.0	Degrees from normal
Average Daily Minimum Temperature	65.6	Which is	-0.3	Degrees from normal
Highest Temperature	94.0	On	May 21	
Lowest Temperature	55.0	On	May 03	

Rainfall

Total Rainfall for the Month	3.17	Which is	-0.38	Inches from normal
Greatest Calendar Day Rainfall	1.07	On	May 31	
Rainfall Year to Date	19.68	Which is	5.80	Inches from normal

Heating Degree Days

Total for the Month	0	Which is	0	Degree days from normal
Total for the Season (Jul - Jun)	610	Which is	-76	Degree days from normal

Cooling Degree Days

Total for the Month	402	Which is	33	Degree days from normal
Total for the Season (Jan - Dec)	797	Which is	-8	Degree days from normal

Monthly Summary
Temperature

Average Monthly Temperature	83.5	Which is	1.0	Degrees from normal	
Average Daily Maximum Temperature	92.6	Which is	1.1	Degrees from normal	
Average Daily Minimum Temperature	74.4	Which is	1.0	Degrees from normal	
Highest Temperature	96.0	Last on	Aug 30	Plus	2 More day(s)
Lowest Temperature	70.0	Last on	Aug 06	Plus	1 More day(s)

Rainfall

Total Rainfall for the Month	5.60	Which is	-1.18	Inches from normal	
Greatest Calendar Day Rainfall	1.37	On	Aug 05		
Rainfall Year to Date	35.47	Which is	0.24	Inches from normal	

Heating Degree Days

Total for the Month	0	Which is	0	Degree days from normal	
Total for the Season (Jul - Jun)	0	Which is	0	Degree days from normal	

Cooling Degree Days

Total for the Month	579	Which is	36	Degree days from normal	
Total for the Season (Jan - Dec)	2580	Which is	213	Degree days from normal
